Editor's Message

The field of environmental public health is broad, and that can be a challenge for professionals trying to stay on top of events and new knowledge. As soon as we think we have a handle on issues, new ones emerge and new challenges present themselves. This will likely continue to be so in the foreseeable future.

In this issue of the *Environmental Health Review*, we explore the traditional, the new, and the future. The three technical articles in this issue show the breadth required in being an environmental public health professional. We have an investigation of a multijurisdictional *E. coli* outbreak representing the traditional. We have the exploration of sous vide cooking and the new hazard it may possibly represent in the category of new. Finally, we have a paper on managing in the 21st century representing the future.

It is interesting seeing the breadth of technical articles that are submitted to this journal. There is much we need to explore and much that is currently being explored. It is true we need more environmental public health evidence. The more information we continue to publish, the more we can share stories about successful or interesting environmental public health practices. This increases the knowledge level of all involved.

We are continuing to seek high-quality articles for publication, so please keep them coming.
